

Alfa Laval Alhop dry hopping system

Dry hopping

Introduction

Alhop dry hopping system is a stand-alone unit for medium sized breweries that accelerates and facilitates the dry hopping/cold hopping process.

Application

The Alhop unit covers the four main stages of the dry hopping process:

- Introduction of hop pellets
- Disaggregation
- Aroma and flavour extraction
- Separation of hop solids

The cross-flow based technology also allows for alpha acids recovery.

Benefits

- Enhanced yield and reduced use of hops
- Fast and efficient extraction rate owing to dynamic agitation
- High product throughput with no risk of clogging due to the cross-flow process
- Minimal introduction of hop solids into the tank
- Reduced product losses

Working principle

After introducing hop pellets into the Alhop system, the hops get disaggregated in the beer and are kept homogenized by means of a cross-flow recirculation loop. The Alhop system is then continuously fed with feed beer, while dry-hopped beer discharges continuously through the designated strainer.

Once the extraction process is complete, the dry-hopped beer trapped in the system can be recovered by a concentration and diafiltration process.

To recover alpha acids, the hop slurry is washed off with deaerated water (DAW) until it becomes a pumpable suspension of hops in DAW.

Technical data

Hop pellets load per batch	up to 45 kg
Product flow rate	10–15 hl/h
Dimensions LxWxH in mm (in)	2700 (106.3) x 1350 (53.1) x 2060 (81.1)

Dimensional drawing
